

Consumer & Retail Credit Forecasting: DFAST bank case study with Global Regulatory Requirements

Moody's Analytics Risk Practitioner Conference, October 26-28, 2014 in Scottsdale, AZ

Felix Jason Vega Head of US Impairment & Capital Demand Management fvega@barclaycardus.com Barclaycard | Credit Risk Office

Juan M. Licari, Ph.D. Head of Economic & Consumer Credit Analytics - EMEA juan.licari@moodys.com Moody's Analytics

#RPC14

Agenda

- Introductions
- Practical Case Study: Meeting business and global regulatory objectives
 - Forecasting & Stress Testing
 - Challenges around Regulatory Submissions
 - Gaining Value from the Exercise
- Consumer Credit Methodologies & Challenges
 - > Panel-data structures: vintage analysis as a leading example
 - Multi-period simulation techniques
 - > Optimal allocations
 - Reverse stress testing

Practical Case Study

United States vs. Europe – The Core Requirements of Stress Testing Regulations are Aligned Across Regions

| | Europe | United Kingdom | United States |
|---|---|---|---|
| Regulatory Body | EBA / ECB / NCA ¹ | BoE / PRA ¹ | Federal Reserve |
| Coverage | Largest Eurozone/Significant Banks (approx. 128 banks) | Largest UK Banks & Building Societies | BHC&FBO ⁶ ; assets > than \$10bn (DFAST), \$50bn (CCAR) |
| Data Requirements / Reporting | Historical/AQR Data – Core (ADC, TR, CSV) & Additional (CSV) Templates ^{2,3} | FDSF ⁴ – Historical, Year-End Data & P/L Projections | FRY Reports – A/Q/M Data; P/L Projections |
| Modeling Approach | Bottom-Up & Challenger/Top- Down; Firms' Own Models | Bottom-Up /Granular; Firms' Own Models | Bottom-Up; Firms' Own Models; Dynamic Projections |
| Scenarios | Regulatory Baseline, Stress Scenario | Common Stress, Bespoke Firm Stress, Common Baseline | Baseline, Adverse, Severely Adverse; Firms' Scenarios |
| Disclosure | Public Disclosure of Results (Bottom-Up) | Public Disclosure of Results | Public Disclosure of Results |
| Frequency | Annual (2009-2011 EBA); 2014 (ECB) | Annual | Annual (regulator-led); semiannual (bank-led) |
| Corrective Measures / Use of Outputs | Recapitalization Plan | Input Capital Adequacy CRDIV & firms' PRA buffer; FPC Tool ⁵ | Input Capital Plan, Approval by Fed; Dividend Planning,,etc. |

1. European Banking Authority (EBA), European Central Bank (ECB), National Competent Authorities (NCA), Bank of England (BoE), Prudential Regulation Authority (PRA)

4.Firm Data Submission Framework (FDSF)

5. Financial Policy Committee (FPC); Capital Requirements Directive IV (CRD IV)

6. Bank Holding Companies (BHC), Foreign Banking Organizations (FBO)

^{2.}Asset Quality Review (AQR)

^{3.}Advanced data collection (ADC), Transparency (TR) and Calculation, Validation & Support (CSV) Templates

Engaging the Business

- Treat as a full business planning exercise, albeit one with highly pessimistic macroeconomic assumptions (akin to business continuity management)
 - Business Units "BAU" activities
 - Staffing Decisions / Collection Efforts
- Finance should take the lead role, though Risk may provide technical expertise and tools given additional modelling challenges
- Knowledgeable project manager should coordinate work streams
- Significant time should be invested in management actions, ensuring:
 - Actions are realistic given resource and operational constraints
 - Reaction time reflects reality and doesn't assume "benefit of foresight"
 - Customer impact is considered (avoid the sledgehammer)
- Existing mitigation impacts should be separated from new mitigants

Stress testing is a "whole business" exercise.

The Right Tools for the Job

- Sophistication of modelling approach for a given portfolio should be driven by:
 - Portfolio materiality / activity
 - Data availability
 - Sensitivity
- Ideally a single consolidated model would capture all interrelated elements
- Acknowledge the limitations of any one modelling approach, triangulate
 - Top-down vs bottom-up
 - Analytical vs intuitive
 - Predictive vs experiential
- Model output must easily fit into current practices in the Institution
 - Business units manage portfolio with a roll-rate structure in mind
 - Business Units need accounts and Dollars forecasts
 - Business Units need segmentation: retail partnerships / risk levels

There is no one "best" approach.

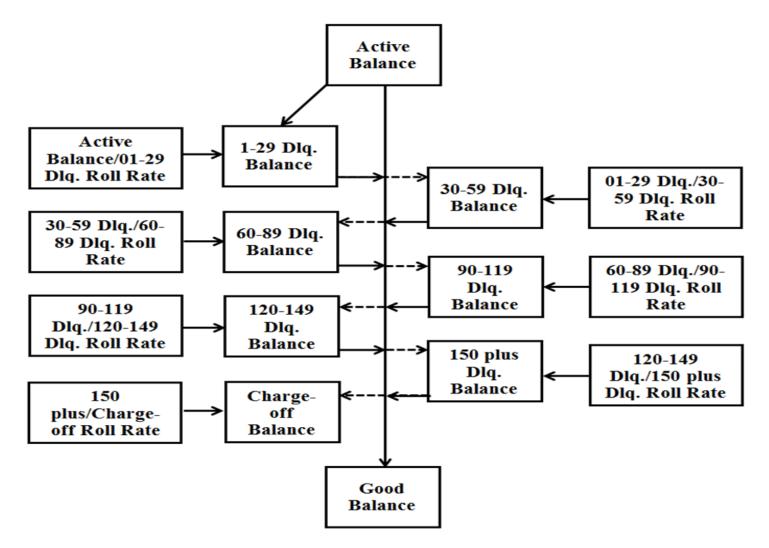

Gaining Value from the Exercise

- Building stress testing models will improve baseline models
- Discussing management actions under highly stressed scenarios improves response time to less severe situations and identifies operational deficiencies preventing effective responses
- Developing strong controls and processes for stress testing improves regular business planning activities
- Meeting rigorous external documentation requirements provides a sound framework for internal documentation
- Offers an opportunity to consolidate organizational knowledge
- Fully documented models
- Modelers support to key personal to ensure proper ownership of the model

Stress testing is a theoretical exercise with practical value.

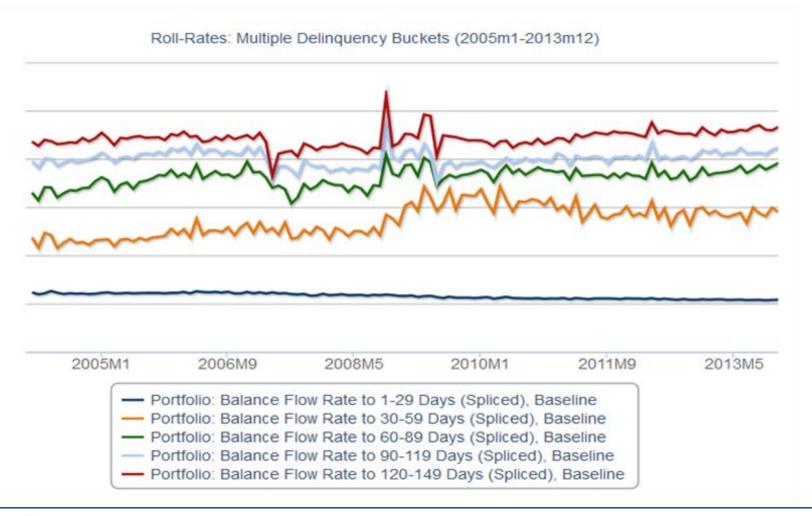

Model Structure Diagram: A Vintage Approach

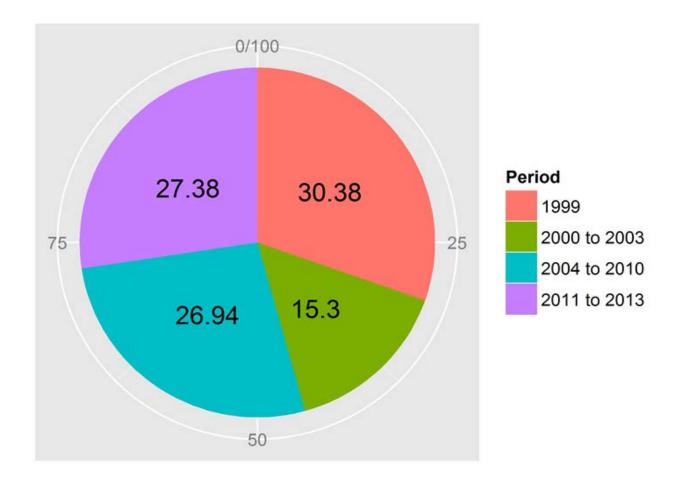

Model Output Portfolio Level Roll-Rates: Multiple Delinquency States

Great Variation in Vintages Sizes (as of 2013m12)

Charge-off Amount Across Segments

Case Study Summary

- Large Credit Card Business with footprint in different countries
 - Engaging the business
 - > Using the right tools
 - Gaining value from the exercise
- Unified methodology to forecast future performance and implement scenario analysis and stress testing exercises
 - > Transparency
 - > Unified methodology facilitates flow of information within the Institution
- On the other hand:
 - > Different Regulatory Environments, particularly around Stress Testing exercises
 - Specific Business Needs

Vintage Methodology and Stress Testing Challenges

Methodology: Dynamic Panel-Data Structure

Time series performance for a given vintage and segment

```
= f
```

(1) Lifecycle component

- » Dynamic evolution of vintages as they mature
- » Nonlinear model against "age"

(2) Vintage-quality component

- » Vintage attributes (LTV, asset class/collateral type, geography, etc.) define heterogeneity across cohorts
- » Early arrears serve as proxies for underlying vintage quality
- » Economic conditions at origination matter
- » Econometric technique accounts for time-constant, unobserved effect

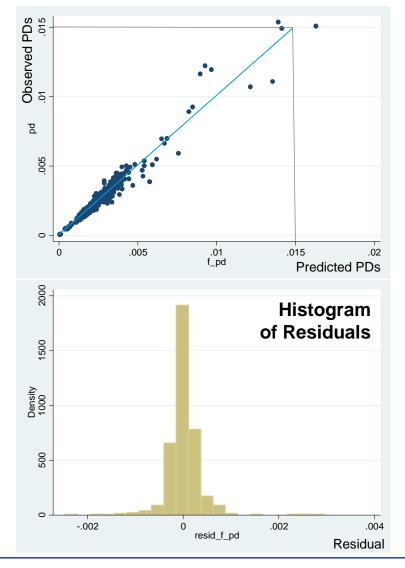

(3) Business cycle exposure component

» Sensitivity of performance to the evolution of macroeconomic and credit series

Portfolio Optimization

What is the portfolio composition n_i that minimises the portfolio loss volatility given a level of expected loss (and hence return) EL = L?

Using the Lagrange multipliers methodology:

 $\Lambda(n_i, \lambda) = \sigma(L; n_i) + \lambda(EL(n_i) - L)$

The efficient frontier can be calculated by solving the following system of equations:

$$n_i C_i + \lambda E L_i^* = 0$$

$$\sum_{i=1}^{N} n_i E L_i^* - L = 0$$
